GARWOOD - COMPACT

Small to medium sized rear loading refuse compactor

This machine is probably the best example of its type currently built in the world today. The concept of COMPACT is a highly efficient, low maintenance, simple design refuse collector which is suitable for operation in many areas.

The range of sizes available in COMPACT are 8, 10 and 12 cubic metres.

The COMPACT is available in full hydraulic lever operation control or with push button PLC control. Compact is designed for use in a variety of climates from the tropical heat of the Pacific to the colds of Northern Europe.

Container handling ability is available covering both plastic wheeled euro bins and steel sloped front bulk bins or uniquely a combination of both.

“Clean Skin” body design is made from pre - stressed, pre - formed joint - less steel panels offering great strength but light weight. This feature results in minimal rust problems and ease of cleaning plus the ability to attach decorative and informative murals to enhance resident awareness of environmental issues.

Compact is fitted with a sullage tank under the tailgate seal area to prevent leakage of liquids onto the ground.

Extremely simple maintenance procedures and the use of durable components and steels ensure long service life.
